
How should our firewall be configured?

Posted by Mario Boutet - 2008/01/22 16:07

An Internet Firewall allows organisations to protect their networks by examining all traffic routed between the network and the Internet. Your organisation's System Administrators typically configure the firewall to block all traffic except for traffic that is specifically required - sometimes this configuration prevents your users from access the DocBanq servers.

DocBanq requires that the HTTPS port (443) be available as a minimum however the DocBanq Firewall Configuration Guide covers the subject in more detail.
